1. Write a pois.prob() function that computes P(X = x), $P(X \neq x)$, P(X < x), $P(X \leq x)$, P(X > x), and $P(X \geq x)$. Enable the user to specify the rate parameter λ .

```
pois.prob <- function(x, lambda, type){</pre>
   # inputs are x, lambda (only parameter of Poison Distribution, and
  #the probability we want to compute
  # lambda = the mean number of events
  \# Use dpois and ppois to conditionally return the correct probability
  if (type == "=="){
     \# P(X = x) \rightarrow pmf
    output = dpois(x, lambda)
  }else if (type == "!="){
    # P(X != x) -> complement rule
    output = 1 - (dpois(x, lambda))
  }else if (type == "<"){
     \# P(X < x) \rightarrow uses cdf
    output = ppois((x-1), lambda)
  }else if (type == "<="){</pre>
     \# P(X \le x) \rightarrow cdf
     output = ppois(x, lambda)
  }else if (type == ">"){
    # P(X > x) -> cdf + complement\ rule output = 1 - (ppois(x, lambda))
  }else if (type == ">="){
    \# P(X \ge x) \rightarrow cdf + complement rule
    output = 1 - (ppois((x-1), lambda))
  } else {
    output = "Not correct type"
  return(output)
# Example Run Through # Question: P(X = x) where x = 0, lambda = 2 following Poison Distribution
pois.prob(x = 0, lambda = 2,"==")
## [1] 0.1353353
# Correct, outputs 0.1353 and that is e^-2 which is the answer
#when calculated analytically
```

2. Write a beta.prob() function that computes P(X = x), $P(X \neq x)$, P(X < x), $P(X \leq x)$, P(X > x), and $P(X \geq x)$ for a beta distribution. Enable the user to specify the shape parameters α and β .

```
beta.prob <- function(x, alpha, beta, type){
  # alpha = success parameter
  # beta = failure parameter
  # support = [0,1] inclusive
  # Beta Distribution is continuous, not discrete
  # Use dbeta and pbeta to conditionally return the correct probability
  if (type == "=="){
    \# P(X = x) \rightarrow pdf
    output = dbeta(x, alpha, beta)
  }else if (type == "!="){
    # P(X \mid = x) \rightarrow pdf, complement rule output = 1 - (dbeta(x, alpha, beta))
  }else if (type == "<"){</pre>
    \# P(X < x) \rightarrow uses cdf.
                                    -> same as <=
    output = pbeta(x, alpha, beta)
  }else if (type == "<="){</pre>
    \# P(X \le x) \rightarrow cdf , same as < due to continuity
    output = pbeta(x, alpha, beta)
  }else if (type == ">"){
    \# P(X > x) \longrightarrow cdf + complement rule
    output = 1 - (pbeta(x, alpha, beta))
  }else if (type == ">="){
    \# P(X \ge x) \rightarrow cdf + complement rule, same as >
    output = 1 - (pbeta(x, alpha, beta))
  } else {
    output = "Not correct type"
```

```
}
return(output)
}
# Example Run Through
beta.prob(x = 0.4, alpha = 2, beta = 5, ">=")
## [1] 0.23328
```
